Now, the file can be played on Android/Windows computer and get the VLC player set up. Why not add a comment? This item is a download only. 8.7 x 6.3 x 3.6.Q: How can I get the dynamic type of an object as a string? I have a complex class, and want to get the name of the type of that class. I know there are many ways to do that, but can you tell me how to do it with a function?

Thanks A: Here's one way using Reflection. E.g.: `Class[] types = ReflectionUtils.getAllClasses();` for (Class type : types) { `System.out.println("Type: " + type.getName());` } This will return all the public classes. If you want to get the "inner" classes, use the `getInterfaces` method instead. To include private classes, use: `Class[] types = ReflectionUtils.getAllClasses(false);` There's a helper library for this, `JavaTokenizer`. This should give you most of what you need to quickly grab the name of a given class. I had to look up the whole thing to be able to get it all (and it was a pleasure) but it worked well enough for my needs. Here's a

---

little example of how to use it: `PackageInfo packageInfo = PackageManager.getPackageInfo( "com.example.myapp", PackageManager.GET_ACTIVITIES); ActivityInfo[] activities = packageInfo.activities; ClassLoader classLoader = Thread.currentThread().getContextClassLoader(); // retrieve an array of all of the classes in the package, // which are found using the package manager List allClasses = new ArrayList(); for (ActivityInfo activityInfo : activities) { // find the class of the activity Class activityClass = classLoader.loadClass(activityInfo.name); // and 82157476af`
